ROSALYNNE, APRIL 2011

FREQUENTLY ASKED QUESTIONS

What are fillers?

Fillers are a gel -like substance which is injected underneath the wrinkle to correct it from the inside. They are made from a natural substance (Hyaluronic Acid), already found in the human body. This substance also deeply moisturises the skin.

Is the treatment painful?

There is some mild discomfort during the injection process. A local anaesthetic cream will be used on the skin before treatment to make the process as comfortable as possible. We use new types of fillers containing a local anaesthetic within them, which makes the post-treatment sensation much more comfortable.

How long do they take to work?

Unlike botox, treatment results are instant. There is some residual improvement over the following few days after treatment and drinking plenty of water is advised to hydrate and 'plump up' the filler.

How long does the effect last?

The longevity of fillers is variable and depends on the individual. However, you should expect fillers to last between 6-12 months.

Are there side-effects?

Serious side effects are rare, but some people experience mild bruising and tenderness to the treated area which usually resolves within a few days. The risk of tissue break down (necrosis) is a very rare complication, which affects less than 1 in 20 000 patients.

Is it safe?

Fillers have been used as a cosmetic treatment for many years and are considered very safe. They give a natural, youthful look to the skin, which is temporary. In the unlikely event that you were not satisfied with the results, the treatment can be reversed using a simple medicine.

PRICE LIST

The areas for treatment

1 nasalabial folds

2 marionette lines

3 fine lines
around chin

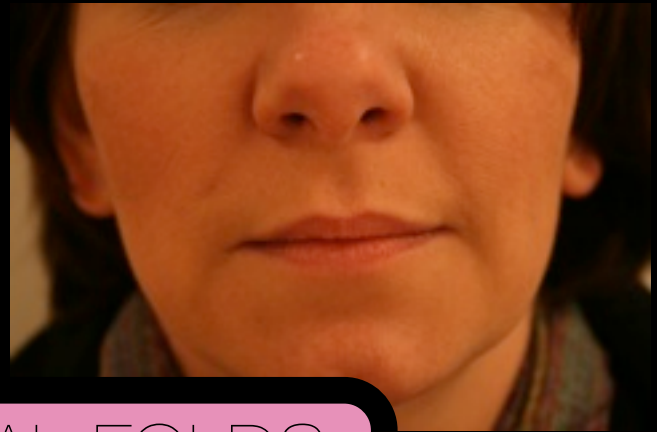

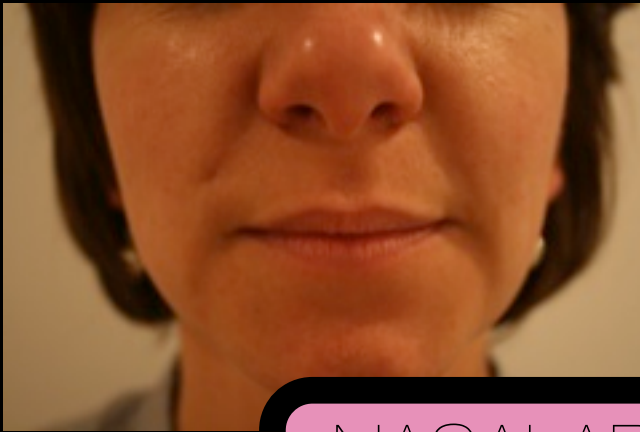

Available from

£180
